

Seeing This Workshop Through the AI Fluency Framework

**Kickoff • Playful Programming and Artificial
Intelligence**

Daniel Spikol

University of Copenhagen • Department of Computer Science

Team for Monday and Tuesday

- Alexander Mittet
- Ida Marie Grøn Nielsen
- Johanne Tang Reuss
- Samia Wahib Ahmed Hassan
- Viktoria Silke Sofia Strandbygaard

Before we start playing

Everything you do this week — cards, sensors, prompts, haikus, a machine narrating a webcam feed — is practice in a skill.

Not "using AI." A specific, learnable, nameable set of skills.

The AI Fluency Framework (Dakan, Feller & Anthropic) gives us the names. We will use it as a lens for the whole five days, starting now.

AI fluency is not prompting

Most training treats "using AI well" as one skill: writing a good prompt.

The framework treats it as **four interconnected competencies** — prompting is only a quarter of one of them.

Fluency means working with AI in ways that are:
effective • efficient • ethical • safe

The 4D Framework

Delegation

Deciding whether, when, and how to bring AI in.

The first and most-skipped decision. Before any prompt: *should this task involve AI at all?*

This morning's card sort ("Is this AI?") is Delegation's twin question, aimed backward: *what even counts as the thing we're deciding to delegate to?*

Description

Communicating clearly enough to get something useful back.

This is where prompting lives — as one technique inside a larger skill of describing goals, context, and constraints.

Tomorrow's "Art of the Prompt" is a Description workout: role, audience, constraints, examples. Craft, not incantation.

Discernment

Judging what comes back.

Is the output good? True? Useful for this audience? Discernment is what stops fluent text from being mistaken for correct text.

"The lying, confident machine" is built entirely to train this muscle — deliberately, before the stakes are real.

Diligence

Taking responsibility for what you did with AI, and being transparent about it.

Not a compliance checkbox. The question a professional — or a student — should be able to answer: *what did I use it for, and am I willing to say so?*

October's classroom reports are Diligence in practice: coming back and being honest about what actually happened.

Three modes, one loop

The 4 Ds operate across three modes of working with AI:

- **Automation** — AI executes a specific task on instruction
- **Augmentation** — human and AI think together
- **Agency** — AI is configured to act independently, later

Most classroom AI use defaults to Automation without anyone deciding that on purpose. **Delegation is the decision most people skip.**

The lens for this week

Every activity you do can be read through the same four questions:

- **Delegation** — what did we hand over, and why?
- **Description** — how did we tell it what we wanted?
- **Discernment** — how do we know if the output is any good?
- **Diligence** — who's accountable for what happens next?

We will return to these four words on **Day 5**, applied to your own classroom activity.

One more thing

The framework is descriptive, not moralising. It does not say *don't use AI*.

It says: **know which of the four you're doing, and do it on purpose.**

Cards are on the tables. Let's argue about a thermostat.
